## Mastitis

Mastitis, or udder inflammation, is the most common disorder in dairy cattle. Mastitis literally means: inflammation of the udder tissue. This can be caused by various bacteria, including *E. coli*, *Staphylococcus aureus* and *Streptococcus uberis*. It is a serious cost item for dairy farmers due to milk production declining, antibiotics often being required, the milk subsequently no longer being accepted for processing, and a penalty being payable for exceeding the tank cell count. There are two manifestations of mastitis, namely clinical mastitis and sub-clinical mastitis. Clinical mastitis is easy to observe (red udder, flakes in the milk), but sub-clinical mastitis is less visible, despite the presence of a genuine infection. The somatic cell count in the milk of the cow concerned is therefore also a way to trace sub-clinical mastitis. Sub-clinical mastitis can develop into clinical mastitis. That's why it's important to treat sub-clinical mastitis and prevent problems.

## Topro Udder bolus

Topro Udder bolus has been developed to improve the overall health and udder health. This bolus consists of a well-designed balance of essential oils of garlic, clove and eucalyptus. These ingredients have an antibacterial effect but are also potent anti-inflammatory agents. This bolus has a gradual release of 21 days.

## Composition
